

Health Care Discrimination Harms Communities of Color in California

Rapidly escalating medical costs and insurance premiums, rising numbers of people without coverage, and rip-offs by monopolistic private insurers have dominated the California political dialogue surrounding President Barack Obama's plans for comprehensive health reform. On Capitol Hill, the American public is witnessing an historic clash of Washington special interest groups fighting to protect their revenue streams. Yet no one has more at stake than the 103 million people of color in the U.S.,¹ including the 21,062,000 in California.² Throughout the nation's history, communities of color have been forced to accept health care that bears little resemblance to what is experienced by members of more advantaged groups. For people of color in California and nationwide, life is shorter, chronic illness more prevalent and

disability more common. These are predictable side-effects of a health care system that provides these communities in California with narrower opportunities for regular health services, fewer treatment options and lower-quality care.

The infant mortality rate, a leading indicator of community health and well-being, illustrates the huge health disparities between whites and other racial and ethnic groups in California. The infant death rate for whites is 4.6 per 1,000 live births, compared with 11.4 for African Americans.³ Life expectancy for African Americans in California is 6 to 10 years shorter than that of whites.⁴ About 31 percent of Latinos and 19 percent of African Americans in California are uninsured, compared with 12 percent of whites.⁵

California Disparities

- In California, about 12 percent of African-American adults have been diagnosed with diabetes, a rate almost 45 percent greater than for whites.⁶
- Among adult African Americans in California, 15 percent have asthma, compared to 9 percent of whites and 5 percent of Latinos.⁷
- In California, 18 percent of African American women received no early prenatal care, compared with 16 percent of Latinas and 10 percent for whites.⁸
- The infant mortality rate for African Americans in California is two and a half times that of whites.⁹
- The mortality rate for African Americans in California is more than 30 percent higher than for whites.¹⁰
- Despite growing evidence of racial disparities in health status and medical services, no system exists in California for collecting comprehensive state and local data on disparities. As a result, many questions about the health of people of color in California remain unanswered. For example, it is not known how many African Americans or Latinos (compared to whites) have forgone care because they can't afford it.
- The U.S. Bureau of Labor Statistics estimates that 12 percent of California's labor force is unemployed.¹¹
- In California, 6,701,890 people were uninsured in 2007.¹²
- About 19 percent of African Americans in California are uninsured, meaning that African Americans are more than 50 percent more likely to be uninsured than whites.¹³
- Health insurance premiums for California working families have skyrocketed, increasing 96 percent from 2000 to 2007.¹⁴
- The full cost of employer-sponsored health insurance in California is projected to grow at an annual rate of 8.4 percent, compared to a 1.1 percent increase in income.¹⁵
- About 3,570,000 working non-elderly adults in California do not have health insurance. That comprises 65 percent of the total non-elderly uninsured population.¹⁶

California Racial and Ethnic Disparities by Health Indicator

Health Indicator	White	African American	Latino	Other
Infant Mortality Rate (deaths per 1,000 live births)	4.6	11.4	5	-
Diabetes Mortality Rate (deaths per 100,000 population)	22.7	47.6	-	19.5
Annual AIDS Case Rate (per 100,000 population)	15.6	55.6	15.6	-
Living in Poverty	10%	28%	27%	17%
Enrolled in Medicaid	9.0%	24%	24%	10%
Uninsured	12%	19%	31%	16%

Note: - denotes insufficient data in state.
